

# COM-1019 DIRECT-SEQUENCE SPREAD-SPECTRUM MODULATOR 20 Mchip/s

# Key Features

- Direct sequence spread-spectrum (DS-SS) modulator.
- Programmable chip rates up to 20 Mchip/s.
- Spreading codes:
  - Gold sequences (up to  $2^{23}$ -1 chips).
  - Maximal length sequences, (max length  $2^{23}$ -1 chips).
  - o Barker codes (length 11, 13).
  - GPS C/A codes.
- code modulation: BPSK/QPSK/OQPSK with output spectral shaping filter: raised cosine square root filter with 20%, 25%, 35% or 40% rolloff. Filter can be bypassed.
- Internal generation of pseudo-random bit stream and unmodulated carrier for test purposes.
- Built-in channel impairments generation:
   additive white Gaussian noise
   frequency offset (Doppler)
- Connectorized 3"x 3" module for ease of prototyping. Standard 40 pin 2mm dual row connectors (left, right). Single 5V supply with reverse voltage and overvoltage protection. Interfaces with 3.3V LVTTL logic.

# Block Diagram

For the latest data sheet, please refer to the **ComBlock** web site: <u>www.comblock.com/download/com1019.pdf</u>. These specifications are subject to change without notice.

For an up-to-date list of **ComBlock** modules, please refer to <u>www.comblock.com/product\_list.htm</u>.

# **Electrical Interface**

# **Modulator Inputs / Outputs**

Two basic types of input connections are available for user selection:

- direct connection between data source and modulator.
- single data source to multiple modulators over a shared bus.

over a shared bus.		
Input Module	Definition	
Interface		
Direct connection		
between two		
ComBlocks,		
REG19(4) = '0'		
CLK_IN	Synchronous clock reference	
	for the input interface. All	
	input signals (DATA IN,	
	SAMPLE CLK IN,	
	ENABLE) are read at the	
	rising edge of CLK IN.	
	Recommended maximum	
	frequency: 40 MHz.	
	LVTTL 0 - 3.3V	
DATA_IN[1:0]	Input data stream.	
	In 1-bit serial mode, use	
	DATA IN[0] only.	
	In 2-bit parallel mode,	
	DATA IN[0] is the I data bit	
	DATA IN[1] is the Q data	
	bit	
	The Q data bit is ignored in	
	BPSK mode.	
	LVTTL 0 – 3.3V	
SAMPLE_CLK_IN	Input sample clock. One	
	CLK IN-wide pulse. Read	
	the input signals at the rising	
	edge of CLK IN when	
	SAMPLE CLK IN = '1'.	
	LVTTL $\overline{0} - 3.\overline{3}V$	
ENABLE	Modulator enable input.	
	Internally pulled high.	

Input Module	Definition	
Interface		
Bus connection,		
REG19(4) = '1'		
BUS_CLK_IN	40 MHz input reference clock for	
	use on the synchronous bus.	
BUS_ADDR[3:0]	Bus address. Input (since this	
	module is a bus slave). Designates	
	which slave module is targeted for	
	this read or write transaction.	
	All 1's indicates that the write data	
	is to be broadcasted to all receiving	
	slave modules.	
	Read at the rising edge of	
	BUS_CLK_IN	
BUS_RWN	Read/Write#. Input (since this	
	module is a bus slave).	
	Indicates whether a read (1) or write	
	(0) transaction is conducted. Read	
	at the rising edge of BUS_CLK_IN.	
	Read and Write refer to the bus	
	master's perspective.	
BUS_DATA[15:0]	Bi-directional data bus.	
	Input when BUS_RWN='0'.	
	Output when BUS_RWN='1'.	
	Read data latency is 2 clock periods	
	after the read command.	
	Functional definition during write:	
	<ul> <li>bit 0 SAMPLE_CLK_IN. '1'</li> </ul>	
	when DATA_IN is available	
	<ul> <li>bit 1 DATA_IN data stream to</li> </ul>	
	modulator.	
	• bits(15:2) undefined	
	Functional definition during read:	
	• <b>bit 0</b> SAMPLE_CLK_IN_REQ	
	requests data from the source.	
	Used for flow control.	
	• bits(15:1) undefined	

Two basic types of output connections are available for user selection:

- connection to dual 10-bit DACs, parallel I and Q samples, output sampling clock.
- connection to dual 14-bit DACs, multiplexed I and Q samples, input sampling clock.

Definition	
40 MHz synchronous clock	
reference for the output interface.	
The output signals	
DATA_I_OUT, DATA_Q_OUT,	
SAMPLE_CLK_OUT change	
immediately after the rising edge	
of CLK_OUT.	
Recommended maximum	
frequency: 40 MHz.	
Modulated output signal, real	
axis. 10-bit precision.	
Format: 2's complement or	
unsigned, selected by	
configuration bit 1.	
Modulated output signal,	
imaginary axis. 10-bit precision.	
Same format as DATA_I_OUT.	
Output signal sampling clock.	
Read the output signal at the	
rising edge of CLK_OUT when	
SAMPLE_CLK_OUT = '1'.	
Sampling rate is either	
4 x symbol rate or fclk	
(interpolation off/on	
configuration bit /).	
SAMPLE_CLK_OUT can stay	
high when output samples are	
CLK OUT periods	
Output compling clock for Digital	
to Analog Converters	
to Analog Converters. $DAC$ reads the output sample at	
the rising edge.	
DB9 connector	
115 Kbaud/s. 8-bit no parity one	
stop bit. No flow control.	
4.75 - 5.25 VDC Terminal block	
Power consumption is	
approximately proportional to the	
sampling frequency $f_{sample clk}$ .	
The maximum power	
consumption at 80 MHz is	
600mA.	

Important: I/O signals are 0-3.3V LVTTL. Inputs are NOT 5V tolerant!

# Configuration

An entire ComBlock assembly comprising several ComBlock modules can be monitored and controlled centrally over a single connection with a host computer. Connection types include built-in types:

• Asynchronous serial (DB9)

or connections via adjacent ComBlocks:

- USB
- TCP-IP/LAN,
- Asynchronous serial (DB9)
- PC Card (CardBus, PCMCIA).

The module configuration is stored in non-volatile memory.

## **Configuration (Basic)**

The easiest way to configure the COM-1019 is to use the **ComBlock Control Center** software supplied with the module on CD. In the **ComBlock Control Center** window detect the ComBlock module(s) by clicking the *Detect* button, next click to highlight the COM-1019 module to be configured, next click the *Settings* button to display the *Settings* window shown below.

# **Configuration (Advanced)**

Alternatively, users can access the full set of configuration features by specifying 8-bit control registers as listed below. These control registers can be set manually through the ComBlock Control Center "Advanced" configuration or by software using the ComBlock API (see www.comblock.com/download/M&C\_reference.pdf)

All control registers are read/write.

Definitions for the <u>Control registers</u> are provided below.

## **Control Registers**

The module configuration parameters are stored in volatile (SRT command) or non-volatile memory (SRG command). All control registers are read/write.

This module operates at an internal processing clock rate  $f_{clk}$  of 80 MHz.

Most processing is done at the sampling rate /  $\mathbf{f}_{sample\_clk} = 4 * chip rate.$ 

In the definition below, a few control register bits may be undefined to maintain backward compatibility with previous versions. They can be ignored by the user when using the latest firmware release.

Parameters	Configuration
Chip rate	24-bit signed integer (2's complement)
	expressed as
	fchip rate * $2^{24}$ / <b>f</b> <sub>clk</sub> .
	The maximum chip rate is $f_{clk}$ /4 (20
	Mchips/s). However, in practice it is
	recommended to limit the maximum
	chip rate to $0.99*(\mathbf{f}_{clk}/4)$ to account for
	possible clock drifts between modulator
	and demodulator.
	REG0 = bits 7-0
	REG1 = bits 15 - 8
	REG2 = bits 23 - 16

Spreading	Spreading code period			
factor	Range: $3 - 2^{23} - 1$

	8-bit unsigned integer.			
	Maximum level 255, Minimum level 0.			
	The holse samples standard deviation is			
	111 Ior a maximum noise gain setting of $255$ (The paige heredwidth is $1/2$ *			
	$253.$ (The hoise ballowidth is $\pm/-2^{\circ}$			
	PEG17 = bits 7.0			
Internal /	This control bit selects the reference			
External	clock source			
reference	■ Reference clock selection must be			
clock	'internal' when this module is the first in			
selection	the transmission chain and when using			
	the internally generated test sequences			
	(see Test mode below).			
	■ Reference clock selection must also be			
	'internal' when user-supplied input data			
	is synchronous with a CLK_IN clock			
	frequency other than the recommended 40 MHz.			
	External reference clock should be			
	used for applications whereby multiple			
	modulators must be exactly synchronized			
	(for example in the case of signal			
	diversity combining applications).			
	0 = internal clock			
	I = external clock			
Output comple	$\frac{\text{REG18 bit U}}{\text{O} = 2^{2}}$			
format	0 = 2 s complement			
	REG18 bit 1			
Modulation	00 = BPSK			
	01 = OPSK			
	10 = OQPSK			
	With BPSK, one data bit is transmitted			
	every code period.			
	With QPSK, two data bits (one symbol)			
	are transmitted every code period.			
	The code spectrum-spreading occurs			
	after QPSK modulation of the data			
	symbols.			
	REG18 bits 3 – 2

Writing or re-writing to the last register (REG20) resets the output interface. When interfacing with  $\frac{6}{6}$ 

the COM-4004 70 MHz modulator, any configuration change in the COM-4004 should be followed by an interface reset.

# **Test Points**

Test points are provided for easy access by an oscilloscope probe.

Test Point	Definition
J1connector pin B7	Chip rate
J1 connector pin B8	Bit rate
J1 connector pin B9	PN code
J1 connector pin A9	PRBS-11 (test sequence) start of sequence.
TP1	FPGA DONE pin. High indicates proper download of the FPGA configuration file.

# Operation

## Spreading codes

Spreading codes are pseudo random sequences which falls within the following categories:

- Gold sequences, for best autocorrelation properties
- Maximal length sequences
- Barker codes (length 11, 13)
- GPS C/A codes.

The same spreading code is used on both the inphase (I) and quadrature (Q) channels.

## **Gold sequences**

Gold sequences are generated using two linear feedback shift registers LFSR1 and LFSR2 as illustrated below:

The code period is  $2^{n}$ -1, where n is the number of taps in the shift register. The LFRSa are initialized to all 1's at the start of each period. The LFRSs will generate all possible n-bit combinations, except the all zeros combination.

Each sequence is uniquely described by its two generator polynominals. The highest order is n. The generator polynominals are user programmable.

A few commonly used Gold sequences are listed below:

n = 5 (length 31): G1 =  $1 + x^2 + x^5$  (0x000012) G2 =  $1 + x + x^2 + x^4 + x^5$  (0x00001B)

n = 6 (length 63): G1 = 1 +  $x^5$  +  $x^6$  (0x000030) G2 = 1 + x +  $x^4$  +  $x^5$  +  $x^6$  (0x000039)

n = 7 (length 127): G1 =  $1 + x^3 + x^7$  (0x000044) G2 =  $1 + x + x^2 + x^3 + x^4 + x^5 + x^7$  (0x00005F)

n = 9 (length 511): G1 =  $1 + x^5 + x^9$  (0x000110) G2 =  $1 + x^3 + x^5 + x^6 + x^9$  (0x000134)

n = 10 (length 1023): G1 =  $1 + x^7 + x^{10}$  (0x000240) G2 =  $1 + x^2 + x^7 + x^8 + x^{10}$  (0x0002C2)

n = 11 (length 2047): G1 =  $1 + x^9 + x^{11}$  (0x000500) G2 =  $1 + x^3 + x^6 + x^9 + x^{11}$  (0x000524)

#### Maximal length sequences

Maximal length sequences are generated using one linear feedback shift register LFSR1 as shown below:

The code period is  $2^{n}$ -1, where n is the number of taps in the shift register. The LFRSa are initialized to all 1's at the start of each period. The LFRSs will generate all possible n-bit combinations, except the all zeros combination.

Each sequence is uniquely described by its generator polynominal. The highest order is n. The generator polynominal is user programmable.

A few commonly used maximal length sequences are listed below:

 $\begin{array}{l} n = 4 \ (\text{length 15}): \\ G1 = 1 + x + x^4 \ (0x000009) \\ n = 5 \ (\text{length 31}): \\ G1 = 1 + x^2 + x^5 \ (0x000012) \\ n = 6 \ (\text{length 63}): \\ G1 = 1 + x + x^6 \ (0x000021) \\ n = 7 \ (\text{length 127}): \\ G1 = 1 + x + x^7 \ (0x000041) \\ n = 8 \ (\text{length 255}): \\ G1 = 1 + x^2 + x^3 + x^4 + x^8 \ (0x00008E) \\ n = 9 \ (\text{length 511}): \\ G1 = 1 + x^4 + x^9 \ (0x000108) \\ n = 10 \ (\text{length 1023}): \\ G1 = 1 + x^3 + x^{10} \ (0x000204) \\ \end{array}$ 

#### **Barker Codes**

11 bit Barker code: 101 1011 1000, or 0x5B8 13 bit Barker code: 1 1111 0011 0101, or 0x1F35

The length (11 or 13) must be entered as spreading factor in REG3/4/5.

#### **GPS C/A Codes**

GPS C/A codes are modified Gold codes of length 1023 with generator polynomials:  $G1 = 1 + x^3 + x^{10}$  $G2 = 1 + x^2 + x^3 + x^6 + x^8 + x^9 + x^{10}$ 

The G2 generator output is slightly modified so as to create a distinct code for each satellite. The G2 output is generated by summing two specific taps of the shift register. In the case of Satellite ID 1 for example, taps 2 and 6 are summed.

The G2 output taps are listed below	v:
-------------------------------------	----

Satellite	G2	Satellite ID /	G2 output
ID /	output	GPS PRN	taps selection
GPS	taps	Signal	
PRN	selection	Number	
Signal			
Number			
1	2 xor 6	21	5 xor 8
2	3 xor 7	22	6 xor 9
3	4 xor 8	23	1 xor 3
4	5 xor 9	24	4 xor 6

5	1 xor 9	25	5 xor 7
6	2 xor 10	26	6 xor 8

13	6 xor 7	33	5 xor 10
14	7 xor 8	34	4 xor 10
15	8 xor 9	35	1 xor 7
16	9 xor 10	36	2 xor 8
17	1 xor 4	37	4 xor 10
18	2 xor 5		
19	3 xor 6		
20	4 xor 7		

Compliant with "Navstar GPS Space Segment / Navigation User Interfaces" specifications, ICD-GPS-200, Revision C. IRN-200C-004, 12 April 2000.

#### **Data Rate**

The data rate is determined by the chip rate, the processing gain (i.e. the spreading code period) and the modulation (BPSK/QPSK).

For a QPSK modulated signal, the data rate is 2 \*fchip rate / processing gain

#### **Filter Response**

This module is configured at installation with a 40% rolloff filter. The filter rolloff can be selected among 20%, 25%, 35% and 40%. Changing the rolloff selection requires loading the firmware once using the ComBlock control center, then switching between up to two stored firmware versions (it takes 5 seconds).

All firmware versions can be downloaded from <u>www.comblock.com/download</u>.

COM-1019-B DSSS demodulator 25% rolloff

- COM-1019-D DSSS demodulator 35% rolloff
- COM-1019-E DSSS demodulator 40% rolloff

To verify which firmware is currently installed, open the settings window and click on the

"Advanced" button. The firmware option is listed at the bottom of the advanced settings window.

#### Filter Response (-A 20% rolloff)

#### Filter Response (-B 25% rolloff)

## Filter Response (-D 35% rolloff)

#### Filter Response (-E 40% rolloff)

# Pseudo-Random Bit Stream (Test Pattern)

A periodic pseudo-random sequence can be used as modulator source instead of the input data stream. A typical use would be for end-to-end bit-error-rate measurement of a communication link. The sequence is 2047-bit long maximum length sequence generated by a 11-tap linear feedback shift register:

# Additive White Gaussian Noise (Test Mode)

To help simulating link impairements, a simple digitally generated noise source is built in this module. The equivalent noise bandwidth is  $\pm -2 x$  chip rate. The noise samples do not undergo raised cosine square root filtering. Therefore its wideband spectrum tends towards a  $\sin(x)/x$  function.

(Noise samples power spectrum over 66,000 samples)

The noise samples standard deviation is 27.8 for a noise gain setting of 64. Below is the amplitude histogram for this noise gain setting.

(Noise amplitude histogram, noise gain 64)

The noise standard deviation is proportional to the noise gain setting.

Below are a few useful reference points for setting the signal to noise ratio. All SNRs are measured in the modulated signal bandwidth, assuming QPSK modulation.

SNR	Signal Gain	Noise Gain
(QPSK	-	
modulation)		
19.3 dB	x40	x20
13.3 dB	x40	x40
10 dB	x40	x5B
7.3 dB	x40	x80
6.1 dB	x40	x90
5.3 dB	x40	xA0
4.5 dB	x40	xB0
3.7 dB	x40	xC0
3.0 dB	x40	xD0
2.3 dB	x40	xE0
1.2 dB	x40	xFF

When BPSK modulation is selected, the SNR is 3 dB lower for a given signal gain and noise gain setting: the reason is that noise is still added on both I and Q channels, whereas data is only transmitted on the I channel.

This noise generator is accurate as far as SNR measurements are concerned. However, it only <u>approximates</u> the Gaussian distribution. Therefore, this noise generator can only be used for bit error rate measurements if it is calibrated. The calibration plot below shows the erfc function for a theoretical Gaussian random variable (red) and for the built-in noise generator (blue).

*Noise generator distribution calibration (erfc function)* 

# Clock / Timing

#### Clocks

The COM-1019 can use two different reference clocks:

- an external clock CLK\_IN/BUS\_CLK\_IN.
- an internal 40 MHz oscillator on the COM-1019 module.

Under user-control (see REG18 bit 0), the COM-1019 selects external versus internal reference clock. Internal clock <u>must</u> be selected while the COM-1019 is in test mode (i.e. no input, the data stream is internally generated). External clock <u>must</u> be selected when synchronizing several modulators for signal diversity combining applications.

The selected clock is used as reference for the output CLK\_OUT clock and, after frequency doubling, as the 80 MHz **f**<sub>clk</sub> processing clock.

(\*) denotes edge-trigger signal

When the internal reference clock is selected, the processing clock  $f_{clk}$  is not related to the CLK\_IN clock frequency. In this case, the role of CLK\_IN is restricted to that of input clock. It can therefore take any frequency value up to the maximum of 40 MHz.

When the external reference clock is selected, we recommend that a 40 MHz clock be used as CLK\_IN.

#### Input buffer

Input data DATA\_IN is first written into an input elastic buffer at the rising edge of CLK\_IN when SAMPLE CLK IN = '1'.

The data is read out of the input elastic buffer at the selected bit rate (chip rate / spreading factor \* 1 (BPSK) or \*2 (QPSK)).

The input buffer size is 256 symbols.

## I/Os

The I/O signals are synchronous with the rising edge of the reference clock CLK\_IN or CLK\_OUT (i.e. all signals transitions always occur after the rising edge of clock). The maximum frequency for CLK\_IN is 40 MHz. The frequency for CLK\_OUT is fixed at 40 MHz ( $f_{clk}/2$ ).

#### **Input Connector**

Point to Multi-points connection (REG19 bit4 = 1). COM-1019 is a bus slave. It always listens to BUS CLK IN, BUS ADDR, BUS RWN.

## **Output Connector**

(REG19 bit0 = 0)

Sample output waveform (63-chip spreading code, 40% rolloff, 10-bit samples, maximum amplitude)

# Mechanical Interface

# Pinout

## Serial Link

The DB-9 connector is wired as data circuit terminating equipment (DCE). Connection to a PC is over a straight-through cable. No null modem or gender changer is required.

DB-9 Female

This connector is used for point-to-point input, i.e. direct connection between two ComBlocks when control register REG19(4) = `0`.

This connector is used for point-to-multipoint (bus) connection when control register REG19(4) = '1'. COM-1019 is a bus slave. It always listens to BUS CLK IN, BUS ADDR, BUS RWN.

#### Output Connector J4

This connector is used when output data is pushed out (configuration REG19 bit 0 = 0).

This connector is used when output data is pulled out by the next module (configuration REG19 bit 0 = 1).

## I/O Compatibility List

(not an exhaustive list)

Input	Output
COM-1010 Convolutional	<u>COM-1418</u> DSSS
encoder	Demodulator 22 Mchips
	(back to back)
COM-7001 Turbo Code	COM-2001 digital-to-
Error correction encoder	analog converter
	(baseband).
COM-1410 LDPC + long	<u>COM-4004</u> 70 MHz IF
BCH code error	modulator
correction encoder	
COM-8001 Arbitrary	COM-1024 Multi-path
waveform generator	simulator
256MB	
COM-8004 Signal	COM-1023 BER generator,
diversity splitter	Additive White Gaussian
	Noise Generator
COM-5003 TCP-IP / USB	
Gateway	

#### **Configuration Management**

This specification is to be used in conjunction with VHDL software revision 12.
